

AutoShack Weekly Tip

SPARK PLUG INSTALLATION AND ENGINE TEMPERATURE

- When you take your vehicle for spark plugs to be replaced, it's highly recommended that your engine cool down (to the point that you can touch it without getting burned) before you replace the spark plug.
- This reduces the possibility of damaging the engine head.
- When metals warm up they get softer so a hot engine head is softer than a cooled one.
- If you accidentally cross threads while installing spark plugs inside a hot head, you're more likely to damage the head by stripping the threads.
